

Análisis de logs del pipeline

Evidencia experimental de tiempos, estados y outputs generados

1. Objetivo

Este reporte resume los logs generados durante el pipeline de reconstrucción y representación 3D. El objetivo es convertir los registros técnicos en evidencia experimental comparable: duración de procesos, estados de ejecución, errores, FPS de render y características de outputs.

6. Conclusión metodológica

El análisis de logs permite reconstruir la secuencia experimental del pipeline y diferenciar procesos exitosos, procesos fallidos y outputs descartados. Esta evidencia resulta útil para la tesis porque no solo compara la calidad final de los métodos, sino también su costo computacional, robustez operativa y compatibilidad con los recursos de hardware disponibles.
